

Drijemovac (*Leucojum vernum*, L.)

Drijemovac je lukovičasta proljetnica koja raste u vlažnim šumama i livadama. Sadrži alkaloide (npr. galantamin) koji imaju primjenu u ljekovite svrhe. Cvjeta rano u proljeće i važan je izvor hrane za prve oprašivače. Drijemovac, u nekim područjima naziva Zvončić, proljetnica je koja je zakonom strogo zaštićena. Glavni razlozi su gubitak staništa (krčenje šuma i pretvaranje u poljoprivredne površine), prekomjerno branje zbog lijepih cvjetova (čime se smanjuje broj jedinki) i sporo razmnožavanje (dug oporavak lukovice nakon oštećenja).

Spring Snowflake

Spring snowflake is a bulbous plant that grows in moist forests and meadows. It blooms early in spring and provides an important food source for the first pollinators of the season.

The plant contains alkaloids such as galantamine, which are used for medicinal purposes. In some regions, it is also called “Zvončić.”

Spring snowflake is strictly protected by law. Its populations are threatened by habitat loss (deforestation and conversion into agricultural land), overharvesting for its attractive flowers (which reduces the number of individuals), and slow reproduction, which makes recovery difficult after damage.
