

Narcisa

(*Narcissus pseudonarcissus*, L.)

Narcise su poznate po žutim cvjetovima i ugodnom mirisu. Sadrže tvari koje mogu biti otrovne ako se progutaju pogotovo za kućne ljubimce. Također, zbog sadržaja određenih tvari odbijaju voluharice i miševe, kao i srne, vjeverice i zečeve pa se zahvaljujući toj osobini od davnina sade za čuvanje kuća i skladišta.

Često se sade u parkovima i vrtovima, a danas postoji gotovo 200 vrsta narcisa i 25.000 hibrida.

Cvjetaju u proljeće i simbol su novog početka.

Daffodils are well known for their yellow flowers and pleasant fragrance. They contain substances that can be toxic if ingested, particularly for pets. These compounds also repel voles, mice, deer, squirrels, and rabbits, which is why daffodils have traditionally been planted near homes and storage areas for protection.

Daffodils are commonly grown in parks and gardens. Today, there are nearly 200 species and around 25,000 hybrids. They bloom in spring and are a symbol of new beginnings.
